

Project Proposal

Initial Draft

I. StudySmart: A Study Time Planner

II. Problem Statement

Students often have several assignments, quizzes, and other school tasks to finish at the same time. It can be difficult to decide which task to work on first and how much time to spend on each one. This can lead to procrastination or unfinished work. The project aims to create a simple program that helps students organize their study time based on their tasks and available time.

III. Project Objectives

1. To create a program that allows students to enter their available study time and school tasks.
2. To organize tasks based on their deadlines and difficulty.
3. To generate a suggested study schedule based on the user's available time.

IV. Planned Features

- Enter the number of tasks.
- Enter the name of each task.
- Enter the difficulty of each task.
- Enter how many days are left before each deadline.
- Enter available study time.
- Calculate and display a suggested order for studying.
- Display the suggested amount of time for each task.

V. Planned Inputs and Outputs

Inputs	Outputs
Task name	List of tasks
Task difficulty	Suggested priority/order
Days until deadline	Suggested study time
Available study time	Study schedule

VI. Logic Plan

Pseudocode

START

Ask the user for their available study time.

Ask the user for the number of tasks.

FOR each task:

 Ask for the task name.

 Ask for its difficulty.

 Ask how many days are left before the deadline.

Determine the priority of each task.

Give higher priority to tasks that:

 Have an earlier deadline

 Have higher difficulty

Divide the available study time among the tasks.

Display the suggested order of tasks

and the suggested study time for each task.
